

Solution Requirements

Date	29 September 2026
Team ID	SWTID-2026-2905
Project Name	LegalEase: AI-Powered Legal Document Generator
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

Create a comprehensive list of requirements to define exactly what the LegalEase solution will do and how well it will perform. Functional Requirements define system features and behaviours, while Non-Functional Requirements define quality, security, usability and performance criteria.

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
1	Authentication	Users can securely register/login and access their documents. Basic identity verification and session control should be provided.	High
2	Authorization levels	User access is limited to their own documents and permitted features. Admin functions, if enabled, require authorized access.	High
3	External interfaces	The application can connect to an AI/LLM API for drafting assistance and a PDF generation service/library for document output.	High
4	Transactions processing	The system accepts document details, validates inputs, sends the request for generation, and returns a structured draft.	High
5	Reporting	Users can preview generated documents and download the final draft as a PDF. Optional history can show previous documents.	Medium
6	Business rules, etc.	Required fields must be completed; selected document type controls the questions/templates; generated content must be reviewable before download.	High
7	Compliance to laws or regulations	Protect personal information, provide a legal-use disclaimer, and avoid presenting the generated draft as a substitute for professional legal advice.	High
8	Other	Allow users to edit generated text, regenerate a draft when needed, and start a new document from the dashboard.	Medium

Solution Requirements

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	Pages, forms and document preview should respond quickly. AI generation should provide a clear progress state while processing.	Normal pages load in ≤ 2 seconds; generation request gives a response/status within 30 seconds in normal conditions.
2	Scalability	The architecture should allow more users, document types and stored documents without redesigning the whole application.	Supports at least 50 concurrent demo users and can be expanded by adding server resources.
3	Security & Data Privacy	Protect login credentials and personal/legal information. Use HTTPS in deployment, secure sessions and restricted database access.	Passwords are hashed; sensitive traffic uses HTTPS; users cannot access another user's documents.
4	Reliability & Availability	The application should handle invalid input and temporary AI/API failures gracefully and preserve completed documents.	At least 99% availability for the deployed demo; errors show useful messages without losing saved data.
5	Usability & Accessibility	The interface should be simple, mobile-friendly and readable, with clear labels, validation messages and accessible controls.	A new user can generate a document without training; forms have labels and clear error feedback.
6	Other	Maintainable modular code, reusable document templates and portable deployment configuration should be used.	Code is separated into frontend/backend modules and can run in a standard Python/Flask environment.

Acceptance Summary: LegalEase should allow an authorized user to select a legal document type, enter required details, generate an AI-assisted draft, review/edit the result, and download it as a PDF, while protecting user data and clearly communicating that the output is a draft requiring appropriate review.
